The world’s most powerful AI models are useless if they have no place to store what they know. Imagine a robot with a brilliant brain but absolutely no memory. Today, we are connecting the missing link in AI Automation

“The Database”

Without it, your hard work remains nothing more than a 'one-time run.'

🗄️ What is a Database

- A database is a system used to store, organize, and manage data efficiently.
- It allows applications to save information and retrieve it whenever needed.
- Instead of keeping data in random files, databases keep it structured and searchable.

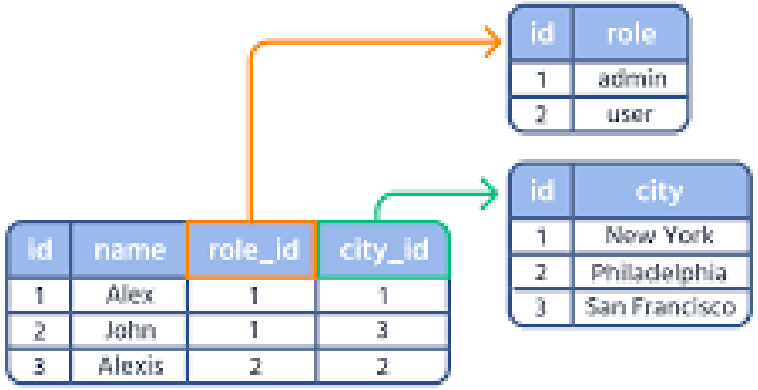
❓ Why We Need a Database

- To store data permanently instead of losing it after a workflow runs.
- To manage large amounts of data efficiently.
- To retrieve and update data quickly when automation needs it.
- To track history and logs of workflows.

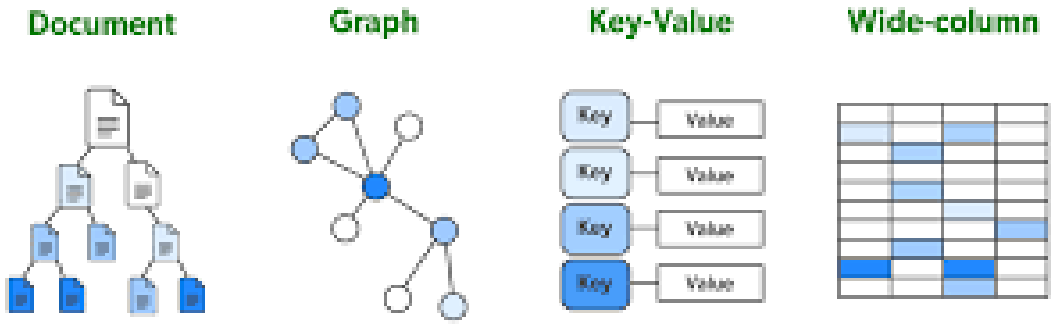
Types of Databases

TechZeen

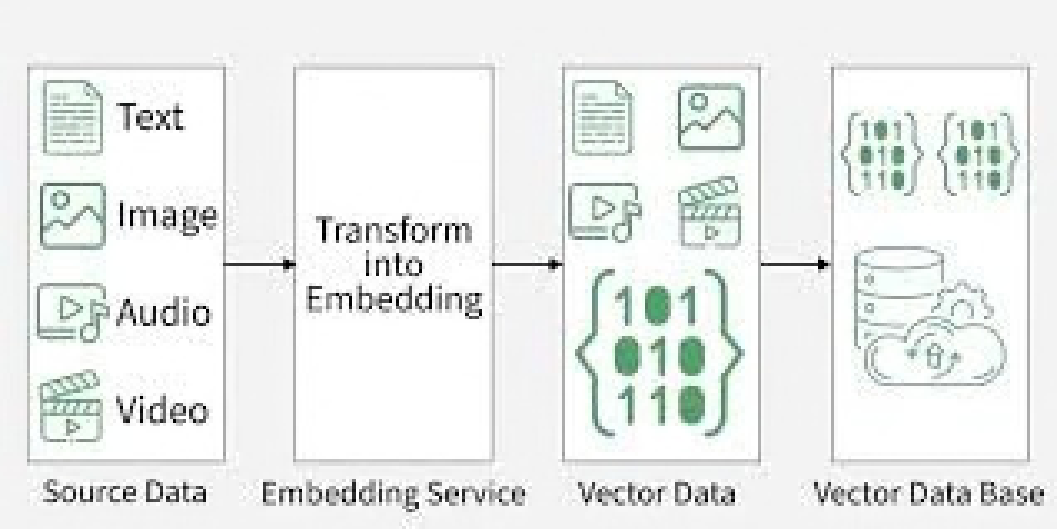
Relational (SQL)



NoSQL



Vector



🐘 PostgreSQL

- It is a powerful open-source relational database.
- Widely used in production applications and SaaS platforms.
- Known for reliability, performance, and scalability.
- Works very well with automation tools and backend systems.

🔄 CRUD Operations

- CRUD represents the four basic operations in databases.
- Create
- Read
- Update
- Delete

🤖 Database in Automation

- Databases play a key role in automation workflows.
- Why databases matter in automation:
- Store workflow results 📊
- Save user information 👤
- Track automation history 🕒
- Enable AI to process stored data 🤖
